Context

The three-way tension in healthcare design

The medical complexity that doctors need, simplicity that patients want, and regulatory requirements that both must navigate.

Patients & providers have very different needs

The simplicity, confidence and on-boarding that create *high patient adoption rates* is at odds with the efficiency and wide toolset required by providers.

My unique value: Design thinking, specific experience, and technical expertise

I teach and utilize the *design research methodologies* necessary to navigate a very complex project through diverse stakeholders.

Experience with *role-based access control*, non-negotiable legal requirements, customer/admin views into the same data, and front-end development.

Specific Experience

Multi-Stakeholder Platform in a Regulated Luxury Market

At *Sotheby's*, I designed unified experiences across **three distinct user groups** within strict art market regulations: **discerning collectors** expecting white-glove digital service, **art specialists** managing million-dollar transactions, and **operations teams** handling complex compliance documentation.

The challenge was creating interfaces sophisticated enough for **expert users**, intuitive enough for **luxury clients**, and efficient enough for **regulatory requirements**.

Through research spanning exclusive events and stakeholder interviews, I delivered a **design system** and **Role Based Access Control** framework that maintained *Sotheby's* premium standards while streamlining workflows—proving regulatory complexity doesn't compromise user experience when you understand each **stakeholder's critical needs**.

Specific Experience

Dual-Sided Service Marketplace Platform

At *Bridgestone*, I led UX/UI for their mobile repair service launch, creating harmonious experiences for **two distinct user groups** with competing needs: customers wanting simple scheduling and convenience, and franchise partners requiring comprehensive order management and operational control.

Managing a **five-person design team**, I developed both customer-facing mobile/web apps and business-facing management tools that integrated complex data sources—**inventory systems, technician capabilities, vehicle compatibility, and real-time location services**. The dual-platform challenge required balancing customer simplicity with business complexity while maintaining brand consistency across touchpoints.

I created a **tokenized design system** that translated *Bridgestone's* print guidelines into **scalable** digital components, enabling **rapid prototyping** and seamless **design-to-development handoff**. The result was a unified ecosystem where customer convenience never compromised operational efficiency.

Specific Experience

Enterprise-Scale Digital Transformation

Working directly with **C-suite** leadership at *Berkley Insurance*, one of the world's largest insurers, I tackled the challenge of unifying dozens of subsidiary brands under a single digital umbrella without losing their market-specific advantages.

My approach centered on extensive stakeholder interviews and **competitive analysis** to understand how each business unit actually operates, then building an **interchangeable widget system** that could adapt to vastly different regulatory environments and customer bases.

Rather than forcing standardization, I created a flexible design architecture where subsidiaries could more mix and match components while maintaining **brand consistency**. The content audit revealed massive redundancies across properties, which I resolved by mapping all content to specific **jobs-to-be-done** frameworks. The result was a scalable system that reduced design debt across the enterprise while actually improving local market performance—essentially creating 30+ websites from one **intelligent component library**.

Ariel has 20 years of experience in New York's competitive design market. His skill set extends from crafting **pixel-perfect UI** to **hardware prototyping** to **service design**.

Ariel teaches and designs curricula and *Parsons, the New School for Design*, and thrives on finding ways **new technology** can delight users and engage human needs.

Flow 03 — with Watson

Faster technology and evolving business models have allowed customers to become more discerning than ever before. But not for nothing: customer data is everywhere.

24/7 Automation and Self-Service means your call center is never operating at less than full efficiency.

Scaled and Augmented Expertise means any way your customers want to reach you, they can. But no matter the

Thank you
